June 7, 2013

Dear Subscriber:

Corn futures traders this week attempted to push the December contract through the gap left over from the Memorial Day weekend, but did not get that accomplished. Weekend wet weather in the western corn belt should provide underlying support to the market as we count down to the next round of USDA reports this upcoming Wednesday – Crop Production and

http://www.andersonsinc.com/wps/portal/corp

http://www.agrigold.com/
WASDE numbers are due out then.

Weather remains very much the key heading into the report – but there are possibilities that the trade will refocus its attention on the demand side of the equation early next week. No one we spoke with this past week believes that USDA’s May WASDE 2 billion bushel corn carryover is any good – most analysts are trimming at least 400 to 600 million bushels off that estimate for a carryover between 1.4 and 1.6 billion bushels, assuming NO June adjustments from USDA on the demand side of the ledger. Here is meteorologist Drew Lerner’s take on the weather for next week:
“Weather conditions across the Midwest are expected to gradually improve after the weekend’s greater rain event. There has already been some improvement with the recent drier weather. Temperatures have not been as warm as they need to be to induce greater degree day accumulations and faster crop development, but a trend toward warmer weather is expected in the coming week to ten days that should eventually provide some of those benefits, although rain will continue to occur routinely across a big part of the nation’s corn and soybean country.

Flooding continues to diminish in the middle Mississippi River Basin, but will continue for a while. The same is true for a part of the Illinois River system.

The greatest rain events over the next two weeks will occur Saturday and Sunday in the western Corn Belt and Sunday and Monday in the east. Rain coverage and amounts will be highest then, but not excessively great outside of a few localized areas in the northwest. Another well organized rain event is expected Tuesday and Wednesday in the western Corn Belt and Wednesday into Thursday morning in the east with another system June 14-16. These storm systems will provide a disruption to needed drying leaving some fields wet, but the trend is still likely to provide some improvement in field access over time, especially as temperatures trend warmer.

Highs through the weekend and early next week will often be in the 60s and 70s in the northern one third of the Midwest corn and soybean belt. Highs elsewhere will be in the 70s and lower 80s. The remainder of next week and the following weekend, June 15-16) will produce high temperatures in the 70s north and 80s in the central and south. Lowest morning temperatures over the coming week will be in the 40s and 50s, but many morning temperatures will be in the 50s and 60s. The coolest morning temperatures are likely this weekend.”

Purdue University ag economist Chris Hurts says that hog profits are on the mend....but livestock producers are keeping a close eye on delayed plantings as they calculate their margins. Chris writes:
“Hog producers generally should keep any expansion plans on hold awaiting better clarification of the size and prices for 2013 crops and the implications for hog production costs. The size of those crops should be more transparent in another 60 days, although late-planting likely means that frost will also be a threat for much of the month of September.

In general, if corn prices stay below $6 per bushel, the pork industry will be able to survive another year of low crop production. Corn prices above $6 would push the outlook back into losses. The opposite would be true of $5 or lower corn prices. Some expansion could be expected with low $5 corn prices and a more aggressive expansion would be expected with corn prices dropping below $5. Expansion, if it occurs, is not expected until the fall.”

Our analysts suggest futures action this past week potentially set the market up for a June/July test of the annual high of 605 set at the beginning of January. December 2013 corn futures managed to hold about the gap left over from the Memorial Day weekend and the 50 day moving average in red in the above chart. Note there is a triple top now on the chart at the 573 level. Our analysts believe closes above that triple top set the market up for rallying to the 6 dollar level. Friday’s corn trade also saw December futures rallying above the 100 day moving average after losing that benchmark earlier in the week.

Our analysts suggest that as long as the gap remains unfilled, additional upside potential remains.

The technical objectives we mentioned last week remain: the circled areas - - April 30 at 570, March 27 at 573 3/4, February 4 at 596 1/2, and January 3 at 605 become the upward technical objectives for a potential June – July rally.
